## Important information for on demand pumps in sub-zero temperatures

This pump is not waterproof, and therefore must be kept dry.

None of our on demand water pumps are designed to operate in sub-zero temperatures or frost conditions.

When temperatures drop to 1 degree Celsius, the pump must be taken out of service.

Switch it off, disconnect it from the water supply and move it to a warm environment.

If water freezes anywhere inside the body of the pump it will become damaged and a repair or replacement would be necessary.

When on hire, the good running order of the equipment is your responsibility and so, if damage occurs you would incur the charges.

Also, for solutions to common problems refer to our troubleshooting guide for on demand pumps which is available on request and features on our website in the Bowser section under Water Pump Hire.
